

EXPERIMENT 5

SELECT with Various Clauses – WHERE, Pattern Matching

AIM:

To view the records from the tables using SELECT commands with WHERE Clause and Pattern matching.

DESCRIPTION:

The SELECT statement allows you to get the data from tables. A table consists of rows and columns like a spreadsheet. Often, you want to see a subset rows, a subset of columns, or a combination of two. The result of the SELECT statement is called a result set that is a list of rows, each consisting of the same number of columns.

PART A — QUESTIONS

WHERE

1. Display the Patient ID, Patient Name and Disease for all patients.
2. List all female patients.
3. List all patients whose age is greater than 25.
4. Display all doctors who joined the hospital after 01-01-1985.
5. Display all appointments that are not allotted to room R101.

LIKE

6. List the patients whose names end with the substring "a".
7. Display all patients whose names contain the substring "an".
8. Find all doctors whose names contain "ri".
9. Display the patients whose names do not contain six letters.
10. Find all doctors whose names contain "av".

OUTPUT:

1)

```
140 • SELECT Patient_ID, Patient_Name, Disease
141 FROM Patient;
142
```

Result Grid	Filter Rows:	Edit:
